

## CLOVER, CRIMSON (*Trifolium incarnatum*)

Crimson clover is probably the most commonly used cool season legume cover crop in the Coastal Plain. It does not produce as much biomass or nitrogen as vetch but is less prone to reseed. It is one of the largest seeded clovers and tends to be one of the earliest flowering of winter legumes. Choosing an early-maturing variety that blooms before termination maximizes the amount of N fixation. Conversely, allowing crimson clover to produce seed lowers nutrient quality and availability for the cash crop and termination should occur when approximately 50% of plants are blooming.

#### **Recommended Varieties**

Variety	Reasons Why	Source			
AU Robin	More suitable for corn. Good biomass, early				
	maturing- flowers about 2 weeks before Dixie. Seed				
	is generally more expensive than Dixie. In some				
	years seed may be difficult to find.				
AU Sunrise	More suitable for corn. Good biomass, early				
	maturing- flowers about 1 to 2 weeks before AU				
	Robin and about 3 to 4 weeks earlier than Dixie. Seed is generally more expensive than Dixie. In				
	some years seed may be difficult to find.				
AU Sunup	Earliest flowering crimson clover.				
Dixie	More suitable for cotton. Good biomass. Seed is				
	available and affordable. The standard crimson				

### **Planting Information**

Information		Comments	Source
Drilled Seed	1/4 - 1/2		Managing Cover Crops Profitably
Depth (inches)			
Drilled Seeding	15 - 20	Use Rhizobium leguminosarum biovar trifolii	Managing Cover Crops Profitably
Rate (lbs/acre)		inoculant	
Broadcast	20 - 30	Into cotton – can use highboy sprayer to spread	Managing Cover Crops Profitably
Seeding Rate		seed before defoliating.	
(lbs/acre)		Into soybeans – broadcast before leaf drop.	
		Into peanuts – after digging and before harvest.	
		In corn – after harvest.	
Aerial Seeding	N/A	There is not much information on aerial seeding of	
Rate (lbs/acre)		clover. Timing should be similar to broadcast.

### **Termination Information**

Information	Source
Crimson clover can be terminated by herbicides, mowing or tillage.  Herbicides - legumes take longer to kill with herbicides than grains. Plan on 2 ½ to 3 weeks for clover to fully die. Mowing - Clover decomposes quickly and mowing will accelerate decomposition and may increase nitrogen loss before crops are able to use it. Rolling/crimping kill at bloom – It is difficult to kill clover with rolling/crimping alone. Several passes may be needed as clover may not reach the minimum 14 inches in height needed for effective crimping. Clover may be terminated by mowing after early bud stage.	Balkcom - personal communication, Managing Cover Crops Profitably
Consult your local Extension and state Pest Management Handbook for herbicide recommendations. Always follow the herbicide label.
