

Oats can produce a good amount of biomass and are the most palatable small grain. Oats are more susceptible to Barley Yellow Dwarf Virus and rust than cereal rye. Oats may winterkill in the Piedmont, Mountains, and Ridge & Valley with successive nights below 20°F. Try the more cold-tolerant varieties in these regions.

Recommended Varieties

Variety	Reasons Why	Source
Coker 277	Standard variety, cold tolerant.	
Horizon 720, NF 402, RAM	Good forage varieties, resistant to crown rust,	UGA Forages
LA99016	good biomass.	
Cosaque	Good cold tolerance, more susceptible to rust	
	than rye or black oats. Cosaque is sometimes	
	mistakenly sold as a black oat but is Avena sativa.	
Heavy Grazer II	Developed for biomass production. Good cold	East Texas Seed
	tolerance.	

Planting Information

Information	Comments	Source
Drilled Seed	½ - 1 ½	Managing Cover Crops
Depth (inches)		Profitably; UGA Forages
Drilled Seeding	60 - 100	Managing Cover Crops
Rate (lbs/acre)		Profitably; UGA Forages
Broadcast	110 – 120	Managing Cover Crops
Seeding Rate	Not	Profitably; UGA Forages
(lbs/acre)	recommended	
	for pastures	

Termination Information

Information	Source
Oats typically winterkill in Zone 7 or colder.	Managing Cover Crops Profitably
Oats can be terminated by heavy grazing. Oats can also be terminated by	GA county agent – personal
herbicides, rolling & crimping, mowing, or tillage. Herbicides are usually more	communication
effective after blooming (anthesis). Farmer experience indicates Cosaque is	
difficult to kill with glyphosate before heading.	
Consult your local Extension and state Pest Management Handbook for	
nerbicide recommendations. Always follow the herbicide label.	

Cultural Traits

Traits	Comments	Source	
Typical Dry	2,000 - 7,000	Managing Cover Crops	
Matter Range		Profitably	
(lbs/acre)			
Typical Total N	N/A		
Range (lbs/acre)			
Life Cycle	Cool season	Managing Cover Crops	
	annual cereal	Profitably	
Growth Habit	Upright	Managing Cover Crops	
		Profitably	
Preferred Soil pH	5.5 - 7.5	Managing Cover Crops	
		Profitably	
Relative Seed	\$\$\$	Based on survey of seed costs	
Cost (\$/acre)		using maximum price and max	
		seeding rate	
Min. Germination	38°	Managing Cover Crops	
Temp (F)		Profitably	
Cautions	Consider feeding a high magnesium mineral when grazing. Cool season grasses and grains can		
	contain inadequate levels of magnesium in early spring, which can result in grass tetany.		
	May be eaten to the ground by deer. Oats are the most palatable of the small grains.		

Forage Traits

Information	Source
Oats can produce high quality forage in late fall (if seeded in mid-fall) and spring in	UGA Forages
the Piedmont, but winter-kill limits their use as you move north and into the	Virginia Cooperative Extension
Mountain regions. Late frosts or cold snaps can also kill/damage spring planted	
oats. They produce more forage, later into the spring than cereal rye and can be	
cut for hay (if mowed with a mower-conditioner) or baleage/silage. However, oats	
are not as productive as ryegrass in the spring and are not very grazing tolerant.	
To extend the production season, oats can be mixed with ryegrass and/or clovers.
